# Piecewise Polynomial Model of the Aerodynamic Coefficients of the *Cumulus One* Unmanned Aircraft

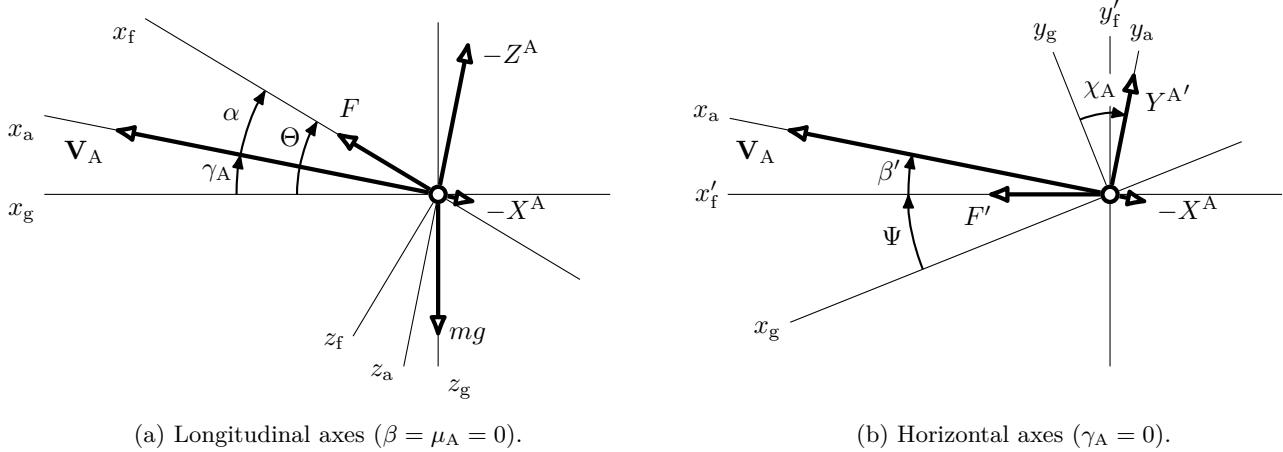

Torbjørn Cunis<sup>1</sup> and Anders La Cour-Harbo<sup>2</sup>

## Abstract

This document illustrates a piecewise polynomial model for Cumulus One, based on continuous fluid dynamics simulation, derived using the `pwpfit` toolbox. The model has been developed in a joint project of Sky-Watch and the University of Aalborg.

## PRELIMINARIES

If not stated otherwise, all variables are in SI units. We will refer to the following axis systems of ISO 1151-1: the *body axis system* ( $x_f, y_f, z_f$ ) aligned with the aircraft's fuselage; the *air-path axis system* ( $x_a, y_a, z_a$ ) defined by the velocity vector  $\mathbf{V}_A$ ; and the *normal earth-fixed axis system* ( $x_g, y_g, z_g$ ). The orientation of the body axes with respect to the normal earth-fixed system is given by the attitude angles  $\Phi, \Theta, \Psi$  and to the air-path system by angle of attack  $\alpha$  and side-slip  $\beta$ ; the orientation of the air-path axes to the normal earth-fixed system is given by azimuth  $\chi_A$ , inclination  $\gamma_A$ , and bank-angle  $\mu_A$ . (Fig. ??.)

(a) Longitudinal axes ( $\beta = \mu_A = 0$ ). (b) Horizontal axes ( $\gamma_A = 0$ ).

## I. AERODYNAMIC COEFFICIENTS

The piece-wise polynomial models of the aerodynamic coefficients are given

$$C_{\odot}(\alpha, \beta, \xi, \eta, \zeta) = \begin{cases} C_{\odot}^{pre}(\alpha, \beta, \dots) & \text{if } \alpha \leq \alpha_0, \\ C_{\odot}^{post}(\alpha, \beta, \dots) & \text{else,} \end{cases} \quad (1)$$

where  $C_{\odot} \in \{C_X, C_Y, C_Z, C_l, C_m, C_n\}$  are polynomials in angle of attack, side-slip, and surface deflections; and the boundary is found at

$$\alpha_0 = 17.949^\circ. \quad (2)$$

The polynomials in low and high angle of attack,  $C_{\odot}^{pre}$ ,  $C_{\odot}^{post}$ , are sums

$$C_{\odot}^{pre} = C_{\odot\alpha}^{pre}(\alpha) + C_{\odot\xi}^{pre}(\beta, \xi) + C_{\odot\eta}^{pre}(\alpha, \eta) + C_{\odot\zeta}^{pre}(\beta, \zeta); \quad (3)$$

$$C_{\odot}^{post} = C_{\odot\alpha}^{post}(\alpha) + C_{\odot\xi}^{post}(\beta, \xi) + C_{\odot\eta}^{post}(\alpha, \eta) + C_{\odot\zeta}^{post}(\beta, \zeta). \quad (4)$$

In the following subsections, we present the polynomial terms obtained using the `pwpfit` toolbox. Coefficients of absolute value lower than  $10^{-2}$  have been omitted for readability.

## II. EQUATIONS OF MOTION

We have the aerodynamic forces and moments in body axis system

$$\begin{bmatrix} X^A \\ Y^A \\ Z^A \end{bmatrix}_f = \frac{1}{2}\rho SV_A^2 \begin{bmatrix} C_X \\ C_Y \\ C_Z \end{bmatrix}; \quad \begin{bmatrix} L^A \\ M^A \\ N^A \end{bmatrix}_f = \frac{1}{2}\rho SV_A^2 \begin{bmatrix} bC_l \\ c_A C_m \\ bC_n \end{bmatrix} + \begin{bmatrix} X^A \\ Y^A \\ Z^A \end{bmatrix}_f \times (\mathbf{x}_{cg} - \mathbf{x}_{cg}^{ref}); \quad (39)$$

and the weight force by rotation into the body axis system

$$X_g^G = -g \sin \Theta; \quad (40)$$

$$Y_g^G = -g \sin \Phi \cos \Theta; \quad (41)$$

$$Z_g^G = -g \cos \Phi \cos \Theta; \quad (42)$$

The resulting forces lead to changes in the velocity vector, in body axis system, by

$$\dot{\mathbf{V}}_{Af} = \frac{1}{m} \begin{bmatrix} X^A + X^G + X^F \\ Y^A + Y^G \\ Z^A + Z^G \end{bmatrix}_f + \begin{bmatrix} p \\ q \\ r \end{bmatrix} \times \mathbf{V}_{Af}. \quad (43)$$

with the thrust  $X_f^F = F$  (engines aligned with the  $x_f$ -axis). For a symmetric plane ( $I_{xy} = I_{yz} = 0$ ), the resulting moments in body axis are given as

$$L_f = L_f^A - q r (I_z - I_y) + p q I_{zx}; \quad (44)$$

$$M_f = M_f^A - p r (I_x - I_z) - (p^2 - r^2) I_{zx}; \quad (45)$$

$$N_f = N_f^A - p q (I_y - I_x) - q r I_{zx}; \quad (46)$$

with the inertias  $I_x, I_y, I_z, I_{zx}$ . The changes of angular body rates are then given as

$$\dot{p} = \frac{1}{I_x I_z - I_{zx}^2} (I_z L_f + I_{zx} N_f); \quad (47)$$

$$\dot{q} = \frac{1}{I_y} M_f; \quad (48)$$

$$\dot{r} = \frac{1}{I_x I_z - I_{zx}^2} (I_{zx} L_f + I_x N_f). \quad (49)$$

Here, the normalized body rates have been used with

$$\begin{bmatrix} \hat{p} \\ \hat{q} \\ \hat{r} \end{bmatrix} = \frac{1}{2V_A} \begin{bmatrix} b p \\ c_A q \\ b r \end{bmatrix} \iff \begin{bmatrix} p \\ q \\ r \end{bmatrix} = 2V_A \begin{bmatrix} b^{-1} \hat{p} \\ c_A^{-1} \hat{q} \\ b^{-1} \hat{r} \end{bmatrix} \quad (50)$$

and

$$\begin{bmatrix} \dot{\hat{p}} \\ \dot{\hat{q}} \\ \dot{\hat{r}} \end{bmatrix} = \frac{1}{V_A} \left( \frac{1}{2} \begin{bmatrix} b \dot{p} \\ c_A \dot{q} \\ b \dot{r} \end{bmatrix} - \dot{V}_A \begin{bmatrix} \hat{p} \\ \hat{q} \\ \hat{r} \end{bmatrix} \right). \quad (51)$$

The change of attitude is finally obtained by rotation into normal earth-fixed axis system:

$$\dot{\Phi} = p + q \sin \Phi \tan \Theta + r \cos \Phi \tan \Theta; \quad (52)$$

$$\dot{\Theta} = q \cos \Phi - r \sin \Phi; \quad (53)$$

$$\dot{\Psi} = q \sin \Phi \cos^{-1} \Theta + r \cos \Phi \cos^{-1} \Theta. \quad (54)$$

### III. LONGITUDINAL MODEL

The longitudinal model is restricted to the  $x_a$ - $z_a$ -plane, assuming  $\beta = \mu_A = \chi_A = 0$ .

#### A. Aerodynamic Coefficients

The longitudinal aerodynamic coefficients,  $C_L, C_D, C_m$ , are obtained as

$$\begin{bmatrix} C_L \\ C_D \end{bmatrix} = \begin{bmatrix} +\sin \alpha & -\cos \alpha \\ -\cos \alpha & -\sin \alpha \end{bmatrix} \begin{bmatrix} C_X \\ C_Z \end{bmatrix}. \quad (55)$$

#### B. Equations of motion

The longitudinal equations of motion are given as

$$\dot{V}_A = \frac{1}{m} \left( T \cos \alpha - \frac{1}{2} \rho S V_A^2 C_D(\alpha, \eta, q) - mg \sin \gamma_A \right), \quad (56)$$

$$\dot{\gamma}_A = \frac{1}{m V_A} \left( T \sin \alpha + \frac{1}{2} \rho S V_A^2 C_L(\alpha, \eta, q) - mg \cos \gamma_A \right), \quad (57)$$

$$\dot{q} = \frac{1}{I_y} \frac{1}{2} \rho S c_A V_A^2 C_m(\alpha, \eta, q); \quad (58)$$

$$\dot{\Theta} = q; \quad (59)$$

with

$$\Theta = \alpha + \gamma. \quad (60)$$
